The BMW Group is committed to sustainable principles and is transforming production research to focus on cleaner technologies. This ensures that the company’s product portfolio is continually refined and improved. The substances involved in the production of our vehicles include technical substances that are both essential and potentially harmful to the environment. Our aim is that all key substances that are technically required in the products are still contained. The substances are incorporated in such a way that they pose no risk to the consumer, employees, and the environment in terms of health and safety. The company’s goal is to ensure that the substances used are used in the least toxic form possible. Self-use of the product is described in the owner manual that is consistent with our own commitment to promote the responsible use of lubricants, fuels, and other end-use products. Our information on the sale and use of vehicles and vehicle parts includes safe use information for service personnel. An additional commitment is made with respect to safety, the environment, and the health and safety of employees. The BMW Group is also committed to the responsible use of technical substances that are technically required in the products. The company is continuously working on reducing the use of substances that are harmful to the environment and are still contained in the products. Our primary goal is to ensure that all key substances that are technically required in the products are still contained.
